

# How to Treat River Water

1. Remove large particles and visible dirt by straining the water through a T-shirt or fine cotton material.

2. Add one Biox Aqua tablet to one litre of water in a drinks bottle. If the water is heavily contaminated add two tablets.

3. Close the bottle and shake.

4. Leave to stand for ten minutes until it is fully dissolved.

5. The water is now safe to drink! The tablets do not leave any bad tastes or colours behind.

*"Used this on mountain water in Africa and had no upset stomach. I would use the tablets again with confidence."*

## Quick facts:

- One pack of tablets treats up to 30 litres of water.
- Chlorine Dioxide is 2.6 x more powerful than Chlorine and works faster!
- No harmful carcinogens or by products are created by Biox Aqua, unlike equivalent Chlorine products.

## Don't forget...

Biox Aqua is also available in a droplet form. One pack of Biox Aqua Drops treats up to 60 litres of water. Perfect for long-stay expeditions.
